How my matching works

Product Finder, explained like you're five

Say you have a toy car and you want to know if other shops have **the exact same car**. Not one that looks a bit like it. Not the same car in another colour. The very same one.

That's what my app does. You give it an Amazon link, and it goes and looks in Flipkart, Croma and Myntra.

1. Look at the stickers

Every product has a few stickers that make it *that* product:

- **Who made it**: Samsung, Nike, Puma
- **What it's called**: Galaxy S25 Ultra, Air Max Bia
- **One or two extra ones**: a phone has how much it remembers (RAM) and how much it holds (storage), a TV has its screen size, and shoes and T-shirts have their colour

2. Ask the other shops

I ask every shop at the same time: *"show me things like this"*. Each one gives me a pile of products that look similar.

3. Check every sticker

I pick up each product from the pile and check the stickers one by one.

- All stickers the same? **It's the same toy.**
- Even one different? **Not my toy.** Put it back.

So a Galaxy S25 Ultra with 512 GB is put back when mine has 256 GB. An S24 is not an S25. A "Nord CE6 **Lite**" is not a Nord CE6. White-and-green shoes are not white-and-black shoes.

And if a sticker is **missing**, I don't guess. Missing means no match.

4. Tidy the words first

Shops write the same thing in different ways: "12GB" and "12 GB", "Grey" and "Gray", "Desert Dust" is really just beige, 138 cm is 55 inches. So I tidy the words up before comparing. But I never tidy away the important bits like "Pro", "Ultra", "Lite" or the numbers, because those make it a different product.

5. TVs have a secret code

Lots of TVs share a name like "Crystal 4K", so for TVs I check the model number printed on the box, like 43NU870BPLA. It has to be the same. (Some shops write a shorter version, 43NU870, which is fine because it's the start of the same code.)

6. Can you buy it?

- 🟢 **In stock**: found it, and you can buy it now.
- 🟠 **Out of stock**: found it, but it's sold out right now.
- ⚫ **Not listed**: this shop doesn't have it. I also show the closest thing I found and what was different about it.
- 🔴 **Couldn't check**: the shop didn't let me in. Myntra does this to my server. I'd rather say "I don't know" than say "not listed" when I never got to look.

In one line: I check every sticker, I never guess when one is missing, and I'm honest when I couldn't look.
